1.0 INTRODUCTION

1.1 General Description

This document describes the specifications of the Samsung SSD PM9A3, which is a native-PCIe SSD for enterprise application.

The Samsung SSD PM9A3 presents outstanding performance with instant responsiveness to the host system, by applying the Peripheral Component Interconnect Express (PCIe) 4.0 interface standard, as well as highly efficient Non-Volatile Memory Express (NVMe) Protocol.

The Samsung SSD PM9A3 delivers wide bandwidth of up to 6,800MB/s for sequential read speed and up to 4,000MB/s for sequential write speed under up to 13.5W power. With the help of Toggle 2.0 NAND Flash interface, the Samsung SSD PM9A3 delivers random performance of up to 1000KIOPS for random 4KB read and up to 200KIOPS for random 4KB write in the sustained state.

By combining the enhanced reliability Samsung NAND Flash memory silicon with NAND Flash management technologies, the Samsung SSD PM9A3 delivers the extended endurance of up to 1 drive writes per day over 5 years, which is suitable for enterprise applications, in U.2 form factor line ups: 960GB, 1920GB, 3840GB, 7680GB and 15360GB

In addition, the Samsung SSD PM9A3 supports Power Loss Protection (PLP). PLP solution can guarantee that data issued by the host system are written to the storage media without any loss in the event of sudden power off or sudden power failure.

2.5 Power

The Samsung SSD PM9A3 is implemented in standardized U.2 form factor and gets primary 12V power from the host system.
For 12V, the allowable voltage tolerance and noise level in SSD are described in chapter 2.5.1, the power consumption in 2.5.2 and the inrush current in 2.5.3.

2.5.1 Maximum Voltage Ratings (12V)

[Table 8] Allowable Voltage Tolerance[1)]

Operating Voltage	960GB	1920GB	3840GB	7680GB	15360GB
12V	10%V				
12V Noise level	DC to 100Khz :960mVp-p Max 100Khz to 20Mhz : 150mVp-p Max				
12V Min Off time	10ms				
3.3Vaux	10%				

NOTE:
1) The components inside SSD were designed to endure the range of voltage fluctuations, which might be induced by the host system.

2.5.2 Power Consumption (12V)

In enterprise server and storage system, the Samsung SSD PM9A3 is designed for the specific usage, which means that SSD will be always operated by the host system during the entire life. Hence, the Samsung SSD PM9A3 does not manage any low power modes except for the Active/Idle and Off mode.

[Table 9] Power Consumption (12V Supply Voltage)[1)]

Power Mode		960GB	1920GB	3840GB	7680GB	15360GB
Active[2)]	Read	9.5W	10.0W	11.0W	11.0W	11.0W
	Write	8.0W	12.5W	13.5W	13.5W	13.5W
Idle[3)]		3.5W	3.5W	3.5W	3.5W	4.0W

NOTE:
1) Power consumption was measured in the 12V power pins of the connector plug in SSD. The active and idle power is defined as the highest averaged power value, which is the maximum RMS average value over 100 ms duration.
2) The measurement condition for active power is assumed for Maximum power between sequential or random performancein PCIe Gen4.
3) The idle state is defined as the state that the host system can issue any commands into SSD at any time.

2.5.3 Inrush Current

[Table 10] Inrush Current

Inrush Current	960GB	1920GB	3840GB	7680GB	15360GB
12V	1A[1)]				

NOTE:
1) The measurement value of inrush current is also compatible with the standard specification of “Enterprise SSD Form Factor Version 1.0a” released by SSD Form Factor Working Group.

2.5.4 Power Loss Protection

By using internal back-up power technology, the Samsung SSD PM9A3 supports power loss protection (PLP) feature to guarantee the reliability of data requested by the host system. When power is unpredictably lost, SSD can detect automatically this abnormal situation and transfer all user data and meta-data cached in DRAM into the Flash media during any SSD operations.

2.6 Reliability

The reliability specification of the Samsung SSD PM9A3 follows JEDEC standard, which are included in JESD218A and JESD219A documents

2.6.1 Mean Time Between Failures

By definition, Mean Time between Failures (MTBF) is the estimated time between failures occurring during SSD operation.

[Table 11] MTBF Specifications

Parameter	960GB	1920GB	3840GB	7680GB	15360GB
MTBF	2,000,000 Hours				

2.6.2 Uncorrectable Bit Error Rate

By definition, Uncorrectable Bit Error Rate (UBER) is a metric for the rate of occurrence of data errors, equal to the number of data errors per bits read as specified in the JESD218 document of JEDEC standard.

[Table 12] UBER Specifications

Parameter	960GB	1920GB	3840GB	7680GB	15360GB
UBER	1 sector per 10^{17} bits read				

2.6.3 Data Retention

By definition, data retention is the expected time period for retaining data in the SSD at the maximum rated endurance in power-off state as specified in the JESD218 document of JEDEC standard.

[Table 13] Data Retention

Parameter	960GB	1920GB	3840GB	7680GB	15360GB
Data Retention[1)]	3 months				

NOTE:
1) Data retention was measured by assuming that SSD reaches the maximum rated endurance at 40C in power-off state.

2.6.4 Endurance

By definition, the endurance of SSD in enterprise application is defined as the maximum number of drive writes per day that can meet the requirements specified in the JESD218 document of JEDEC standard.

[Table 14] Drive Write Per Day (DWPD)

Parameter	960GB	1920GB	3840GB	7680GB	15360GB
DWPD	1 Drive writes per day over 5years				

[Table 15] TBW (Tera Bytes Written) Specifications

Parameter	Unit	960GB	1920GB	3840GB	7680GB	15360GB
TBW	TB	1752	3504	7008	14016	28032

NOTE:
1) TBW is measured while running 100 % random 4 KB writes across the entire SSD.(TBW = DWPD x 365 x 5 x User capacity).

2.7 Environmental Specification

2.7.1 Temperature

[Table 16] Temperature, Case (Tc[1)])

2.7.2.2 Composite temperature ($T_{composite}$)

The $T_{composite}$ is defined by the correlation equations as the below.

$T_{composite}$ = TS

23:16	M	0h	Namespace Utilization A device may report Namespace Utilization equal to Namespace Capacity at all times if the product is not targeted for thin provisioning environments
24	M	12h	Namespace Features Bits 7:5 are reserved. Bit 4 if set to '1' indicates that the fields NPWG, NPWA, NPDG, NPDA, and NOWS are defined for this namespace and should be used by the host for I/O optimization; and NOWS defined for this namespace shall adhere to Optimal Write Size field setting defined in NVM Sets Attributes Entry for the NVM Set with which this namespace is associated. If cleared to '0', the controller does not support the fields NPWG, NPWA, NPDG, NPDA, and NOWS for this namespace; and Optimal Write Size field in NVM Sets Attributes Entry for the NVM Set with which this namespace is associated should be used by the host for I/O optimization. Bit 3 if set to '1' indicates that the non-zero NGUID and non-zero EUI64 fields for this namespace are never reused by the controller. If cleared to '0', then the NGUID and EUI64 values may be reused by the controller for a new namespace created after this namespace is deleted. This bit shall be cleared to '0' if both NGUID and EUI64 fields are cleared to 0h. Refer to section 7.11. Bit 2 if set to '1' indicates that the controller supports the Deallocated or Unwritten Logical Block error for this namespace. If cleared to '0', then the controller does not support the Deallocated or Unwritten Logical Block error for this namespace. Refer to section 6.7.1.1. Bit 1 if set to '1' indicates that the fields NAWUN, NAWUPF, and NACWU are defined for this namespace and should be used by the host for this namespace instead of the AWUN, AWUPF, and ACWU fields in the Identify Controller data structure. If cleared to '0', then the controller does not support the fields NAWUN, NAWUPF, and NACWU for this namespace. In this case, the host should use the AWUN, AWUPF, and ACWU fields defined in the Identify Controller data structure in Figure 111. Refer to section 6.4. Bit 0 if set to '1' indicates that the namespace supports thin provisioning. Specifically, the Namespace Capacity reported may be less than the Namespace Size. When this feature is supported and the Dataset Management command is supported, then deallocating LBAs shall be reflected in the Namespace Utilization field. Bit 0 if cleared to '0' indicates that thin provisioning is not supported and the Namespace Size and Namespace Capacity fields report the same value.

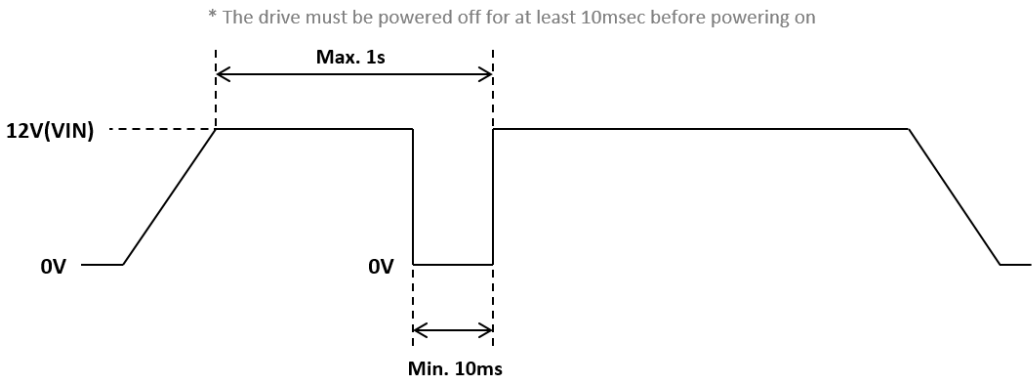
7.0 SPOR SPECIFICATION (Sudden Power Off and Recovery)

7.1 Data Recovery in Sudden Power off

If power interruption is detected, SSD dumps all cached user data and meta data to NAND Flash. SSD could protect even the user data in DRAM from sudden power off while SSD is used with cache on. Commonly, data is protected all of the operation period.

7.2 Minimum Off time

In sudden power off case, minimum 10ms off time is required for stability



7.3 Time to Ready Sequence

In normal power-off recovery status, SSD needs less than 8 seconds to reach operating mode where SSD works perfectly with cache-on state. SSD is ready to respond identify Device command during FTL OPEN. When the sudden power-off occurs, the user data in DRAM will be dumped into the NAND Flash using the stored power in the capacitor. In sudden power-off recovery condition, mapping data will be loaded or the FTL meta data be rebuilt perfectly for initial max. 10 seconds. During this period, Identify Device command is still supported. It is called SPOR. (Sudden Power Off and Recovery)

The 16-bit value is 2s complement representation of a temperature with the Bit 4 equal to the minimum granularity of 1 °C. Bit 12 is the sign bit.
For example:

1. a value of 0190h represents 25 °C,
2. a value of 07C0 h represents 124 °C, and
3. a value of 1E80 h represents –24 °C

By choosing the starting of the lowest bit the resolution of the temperature sensor can be defined. For SMBus temperature capability support PM9A3's temperature sensor is at resolution of 1°C (8-bit)
